背景信息

Infliximab is a chimeric monoclonal antibody and used to treat auto- immune disorders. Infliximab reduces the amount of active human tumour necrosis factor alpha (hTNFa) in the body by binding to it and preventing it from signaling the receptors for TNFa on the surface of various cell types. TNFa is one of the key cytokines that triggers and sustains the inflammatory reactions. Infliximab is used for the treatment of psoriasis, Crohn’s disease, ankylosing spondylitis, psoriatic arthritis, rheumatoid arthritis, ulcerative colitis.
