产品描述

Iv0136 is a bispecific, humanized monoclonal antibody engineered for cancer immunotherapy. It simultaneously targets CD40 and 4-1BB (CD137), enabling coordinated activation of antigen-presenting cells and T cells to enhance anti-tumor immune responses. By engaging these two pathways, Iv0136 is being investigated for its potential to modulate immune activity in both oncology and autoimmune research settings. Preclinical studies indicate that dual CD40/4-1BB targeting may promote tumor control and influence immune regulation in models of diseases such as rheumatoid arthritis and multiple sclerosis.
